

Case Study

Lakeland Regional Health Medical Center

Lakeland, Florida

Build Bolder.

For more than 100 years, Lakeland Regional Health Medical Center has served patients across central Florida, establishing a long legacy of medical excellence. In 2018, this growing health system opened the Carol Jenkins Barnett Pavilion for Women and Children, which houses the county's only Level III NICU as well as an emergency department for children and a wide variety of women's health and pediatric services.

Rising eight stories high and spanning approximately 350,000 square feet, the landmark facility began with a "one architect, one approach, one language" philosophy, which led to an architectural design that has set the standard for the entire Lakeland Regional Health system.

To help create a cohesive flow from the outside in, Cladding Systems, Inc., fabricated 19,410 square feet of Reynobond® 4mm FR Composite Material in a custom Arcadia Silver finish, which our customer designed and affixed to the building using a wet-seal system. Not only did this achieve a sleek, contemporary look, it also helped the building earn LEED® for Healthcare certification from the U.S. Green Building Council®. To date, the Carol Jenkins Barnett Pavilion for Women and Children is the only building in Polk County and only the 18th building in Florida to achieve this designation.
